1. Introduction

On behalf of UniFirst Corporation (UniFirst), ARCADIS has prepared this Indoor Air Quality and Vapor Intrusion Assessment: Report of Second Sampling Round Results for sampling conducted on June 16-17, 2011 at the southern half of the residential duplex in Woburn, Massachusetts, identified in the tax assessors' records as Woburn Parcel Number 26/ 05/ 05 (the Residence). ARCADIS conducted sub-slab soil vapor, indoor ambient air, and outdoor ambient air sampling at the Residence during June 2011. All work was completed in accordance with the *Vapor Intrusion Assessment Work Plan (Work Plan)* approved by the United States Environmental Protection Agency (USEPA) on February 17, 2011 (ARCADIS 2011a).

As stated in the *Work Plan*, USEPA requested that sub-slab soil vapor, indoor air, and ambient air samples be collected from certain residential and commercial properties located on Olympia Avenue, Oregon Avenue, and Marietta Street (Study Area). The Residence is one of the properties that USEPA identified for study. The *Work Plan* was submitted to and approved by USEPA to establish the sampling methods and procedures to be followed. The objectives of the sampling were to:

- Measure concentrations of volatile organic compounds (VOCs) in sub-slab soil vapor and indoor air at each property identified for study by USEPA in the Study Area; and
- Measure concentrations of VOCs in outdoor air near these properties to evaluate atmospheric conditions at the time of indoor air sample collection.

The results of the second round of vapor intrusion sampling, sampling methodology, a discussion of the sampling results including a preliminary human health risk evaluation, and recommendations for future actions are provided below. A comparison of results from both the first sampling round (April 21-22, 2011) and the current (second) sampling round (June 16-17, 2011) is also presented.

2. Sampling Program

Consistent with the *Work Plan* (ARCADIS 2011a), ARCADIS collected a second round of sub-slab soil vapor, indoor air, and ambient air samples from the Residence on June 16-17, 2011. Specific sampling methodologies were consistent with the *Indoor Air Quality and Vapor Intrusion Assessment Scope of Work – Revision 2 (SOW)* (JCO 2010a) and the *Quality Assurance Project Plan – Revision 1 (QAPP)* (JCO 2010b) and

the previous sampling round. Pre-sampling activities, sampling methodologies, and sample locations are described below. Sample logs are provided in Appendix A.

2.1 Pre-Sampling Activities

Prior to sampling, ARCADIS, in coordination with USEPA, was granted access to the Residence from the current property owner. ARCADIS conducted a site reconnaissance to identify the building and foundation condition, building materials, heating, ventilation, and air conditioning (HVAC) operation, and potential preferential vapor migration pathways (i.e., sump pump, floor drains, cracks, etc.). To the extent feasible (the premises are leased to tenants), a product inventory was completed to list items observed in the building that may contain VOCs that could potentially interfere with sample results, and identified VOC-containing products that could be removed were taken out of the basement of the Residence prior to sampling.

During the building survey the following potential background sources were identified:

- Cleaning products containing bleach were noted in the home during the site visit, which may be a source of chloroform via reactions with other cleaning products (Odabasi 2008).
- Various other cleaning products and aerosols were also noted during the product inventory.

Indoor air sampling was conducted only in the basement; however, a limited survey was also extended to the first floor. None of the current tenants were at the home during the sampling and it was not possible to ask about specific background contributions, including dry cleaning. All products found in the basement were containerized and removed from the home approximately 48-hours prior to sampling. The resident also removed her dry-cleaned clothing approximately 24-hours prior to sampling. The building survey and product inventory can be found in Appendix B.

2.2 Indoor Ambient Air Assessment

On June 16, 2011, indoor air samples were collected from two locations on the basement level of the Residence. Indoor air samples collected in the basement were co-located with the installed sub-slab soil vapor points and were consistent with the previous round of sampling. The basement of the Residence is used as a primary living space and, consistent with the approved *Work Plan*, no other floors were sampled.

Sample methods were consistent with the *SOW* (JCO 2010a) and *QAPP* (JCO 2010b). Samples were collected from the breathing zone (3 to 4 feet above ground surface) above each sub-slab soil vapor location. To avoid any cross contamination issues with potential vapors under the floor slab, indoor air samples were collected prior to sub-slab soil vapor samples. To ensure a reasonable worst case scenario, indoor air sampling was conducted with all exterior building doors closed to avoid any dilution with outside air.

Samples were collected over a 24-hour period in individually certified six-liter passivated sample canisters provided by Alpha Analytical, Inc. of Mansfield, Massachusetts (Alpha), a National Environmental Laboratory Accreditation Conference (NELAC) (E87814) certified laboratory. Canisters were analyzed for VOCs by USEPA Method TO-15 featuring selective ion monitoring (SIM). Detailed sample collection methods are included in the *SOW* (JCO 2010a) and in SOP-JCO-063 contained in the *QAPP* (JCO 2010b). Sample logs from indoor air sampling are included in Appendix A.

2.3 Outdoor Ambient Air Assessment

On June 16, 2011, one outdoor air sample was collected from an upwind location outside the Residence using the same methods as described for indoor air samples. The sample was collected to understand what contribution the ambient environment may have on indoor air samples collected from inside the building. Sample locations are presented in Figure 1. The outdoor ambient air and indoor air samples were collected over approximately the same 24-hour time period with the outdoor sample being started immediately prior to the indoor air samples. Sample logs from ambient air sampling are included in Appendix A.

2.4 Sub-Slab Soil Vapor Assessment

Two permanent sub-slab soil vapor sample points were installed in the basement of the Residence on April 20, 2011 (Figure 1). Installation methods for the two points were previously reported in the *Work Plan* and the Indoor Air Quality and Vapor Intrusion Assessment (ARCADIS 2011a, b).

At the completion of the indoor air sampling on June 17, 2011, sub-slab soil vapor samples were collected from two locations in the Residence. The integrity of each sample port was tested using a helium tracer test. These methods were presented in the *Work Plan* (ARCADIS 2011a). One duplicate sample was collected as a quality

control measure utilizing a decontaminated stainless steel “T” fitting provided by the laboratory.

Prior to sampling, three volumes of the sample tubing were purged utilizing a low-flow pump to remove any ambient air from the sampling train. Detailed methods for sampling are included in SOP-JCO-062 contained in the *QAPP* (JCO 2010b). Samples were collected over a 30-minute period in individually certified six-liter passivated sample canisters provided by Alpha. Canisters were analyzed for VOCs by USEPA Method TO-15 featuring SIM. Sample logs from sub-slab soil vapor sampling are included in Appendix A.

Upon the completion of the second round of sub-slab soil vapor sampling (June 17, 2011) the sub-slab soil vapor points were removed. Points were removed from the floor slab using a chisel, hammer, and pry-bar. After removing each sampling point, the drilled hole was vacuumed out and filled with hydraulic cement. Where appropriate, the overlying carpeting was glued back down using low-VOC carpet adhesive.

2.5 Data Synthesis and Reporting

Analytical data packages generated by the laboratory were validated by Phoenix Chemistry Services according to national guidelines for tier III data validation as described in the *SOW* (JCO 2010a) and *QAPP* (JCO 2010b). The data review included: field documentation, proper holding times, proper chain-of-custody documentation, achievement of target reporting limits, acceptable laboratory calibrations and quality control parameters, and representativeness of duplicate results.

Findings of the validation effort resulted in the following qualifications of sample results:

- Results for naphthalene and 1,3-butadiene in all samples were qualified as estimated (J, UJ).
- Positive results greater than the sample-specific (adjusted) quantitation limit but less than the action limit (at twice the detected concentration) for methylene chloride in OA-1, and toluene in samples SS-4, SS-4-Duplicate, and SS-5 were qualified as less than the reported value (U).

Quality control results, including any revisions or qualifiers deemed necessary, are included in Tables 1 and 2. The data validation report is included in Appendix C. The laboratory analytical data package is included in Appendix D.

3. Results and Discussion

This section presents results for indoor air, outdoor ambient air, and sub-slab soil vapor samples collected from the Residence including a summary evaluation of potential human health risks. A copy of the complete Preliminary Human Health Risk Evaluation can be found in Appendix E.

3.1 Indoor and Outdoor Ambient Air Sampling Results

Analytical data for indoor and outdoor ambient air samples are presented on Table 1. The following compounds were detected in both indoor air samples: 1,2,4-trimethylbenzene, 1,2-dichloroethane, 1,2-dichloropropane, 1,3-butadiene, benzene, bromodichloromethane, carbon tetrachloride, chloroform, ethylbenzene, naphthalene, tetrachloroethene (PCE), toluene, and xylenes. Detected concentrations of these constituents are presented in Table 1.

The following constituents were detected in the outdoor ambient air sample: 1,2,4-trimethylbenzene, benzene, carbon tetrachloride, chloroform, ethylbenzene, naphthalene, toluene, and xylenes. Detected concentrations of these constituents are presented in Table 1.

A comparison of the data indicates that several constituents were detected in both outdoor and indoor air. Carbon tetrachloride and naphthalene were measured at similar concentrations in indoor and outdoor air. Although 1,2,4-trimethylbenzene, benzene, chloroform, ethylbenzene, toluene, and xylenes were detected in both outdoor and indoor air, concentrations were slightly greater in indoor air compared to outdoor ambient air.

3.2 Sub-Slab Soil Vapor Sampling Results

Analytical data for sub-slab soil vapor are presented in Table 2. The following compounds were detected in both sub-slab soil vapor samples: 1,2,4-trimethylbenzene, carbon tetrachloride, chloroform, PCE, and toluene. 1,1,1-Trichloroethane and naphthalene were only detected in one sub-slab soil vapor sample,

SS-4. The full list of detected constituents and their concentrations are presented in Table 2.

3.3 Evaluation of Indoor Air and Sub-Slab Soil Vapor Results

The data results for indoor air and sub-slab soil vapor were evaluated together to determine if indoor air samples were associated with a potential background source. As a first step, attenuation factors (AFs) were calculated to evaluate if chemicals present in indoor air are potentially associated with sub-slab soil vapor levels, or if chemicals may be attributable to background sources. The AF is the ratio of indoor air to sub-slab soil vapor results and was calculated when a constituent was detected in both indoor air and sub-slab soil vapor. AFs close to or greater than one indicate that indoor air concentrations are equal to or higher than sub-slab soil vapor concentrations and therefore, that a background source likely is present. Of the 13 chemicals detected in indoor air, AFs could be calculated for five chemicals. The following four chemicals had AFs close to or greater than one: 1,2,4-trimethylbenzene, carbon tetrachloride, chloroform, and naphthalene. As a result, the presence of these chemicals in indoor air is attributable to background sources and not soil vapor intrusion. The calculation of AFs is presented in Table 2 of Appendix E. The AF calculated for PCE was 0.27, which suggests a background source, such as dry cleaned clothing, may be contributing to the concentration noted in indoor air (Magee et al. 2008). As noted above, ARCADIS' field staff did not conduct an inventory in the upstairs portion of the Residence and were not able to interview the actual tenants of the Residence, because they were not present during the sampling event.

Second, the data were evaluated to identify constituents that were detected in indoor air, but not in sub-slab soil vapor. These results indicate that a background material is the only source of the detected indoor air concentrations. The following constituents were identified as having background sources based on this criterion: 1,2-dichloroethane, 1,2-dichloropropane, 1,3-butadiene, benzene, bromodichloromethane, ethylbenzene, toluene, and xylenes.

Third, the results of indoor air and outdoor air samples were compared. Carbon tetrachloride and naphthalene were measured at similar concentrations in both outdoor and indoor air. These results indicate background sources are present in outdoor ambient air.

PCE was detected in indoor air at a lower concentration compared to the co-located sub-slab soil vapor samples. Sub-slab soil vapor therefore may be a contributing

source of PCE detections in indoor air. PCE was detected in indoor air samples in the Residence at concentrations between 1.82 and 2.34 $\mu\text{g}/\text{m}^3$. These results are consistent with background sources throughout the United States. USEPA's indoor air background database reported a 50th percentile value of 0.7 $\mu\text{g}/\text{m}^3$, a 75th percentile value of 1.4 $\mu\text{g}/\text{m}^3$, and a 90th percentile value of 3.8 $\mu\text{g}/\text{m}^3$ (Dawson 2008). These results are slightly above the MADEP TV for PCE (1.4 $\mu\text{g}/\text{m}^3$), but based on the calculated AF it is likely that background sources of PCE (e.g., dry-cleaned clothes) are present in the Residence.

3.4 Residence Human Health Risk Evaluation

Preliminary human health risk calculations were performed using the June 2011 validated indoor air data and a combined data set (i.e., average indoor air concentrations) from the April 2011 and June 2011 sampling events. The Preliminary Human Health Risk Evaluation Report and supporting calculations can be found in Appendix E. The conclusions from that report are summarized below.

Potential risks from inhalation of constituents detected in indoor air were calculated assuming a homebound individual lives in the Residence for 24 hours per day, 350 days per year, for 30 years. For each constituent, the exposure point concentration in indoor air is equal to the average concentration of the two indoor air results from the current sampling round.

To evaluate potential risks over the initial (April 2011) and current (June 2011) sampling events, risks were calculated considering chemicals detected in indoor air from both sampling rounds. Data from April 21 and 22, 2011 were presented in the Indoor Air Quality and Vapor Intrusion Assessment: Report of Results submitted to USEPA on May 23, 2011 (ARCADIS 2011b). Any constituent that was detected in either the April or June sampling event in indoor air was included in the combined risk calculation. Risks were estimated using the average concentration from both sampling rounds. Risks associated with both data sets are referred to as "Combined Results" below.

The estimated total cancer risk associated with long term exposure to indoor air in the basement of the home from the June 2011 sampling round is 5×10^{-5} , primarily due to the presence of 1,2-dichloroethane, chloroform, and naphthalene (69% of risk). Excluding 1,2-dichloroethane, chloroform, and naphthalene, all other chemical-specific risks, including those associated with background sources, are at or below a 5×10^{-6} risk level for the current sampling round. Estimated cancer risk from PCE is equal to 5×10^{-6} .

The estimated total cancer risk associated with long term residential exposure to indoor air in the basement of the Residence using the combined data set is 3×10^{-5} , primarily due to the presence of 1,2-dichloroethane, chloroform, and naphthalene (64% of risk). The majority of risk associated with 1,2-dichloroethane, chloroform, and naphthalene is likely from background sources. Excluding these three chemicals, all other chemical-specific risks, including those associated with PCE, are at or below a 5×10^{-6} risk level for the combined data set. Estimated cancer risk from PCE is equal to 5×10^{-6} .

4. Summary and Conclusions

The potential carcinogenic risk level estimated for a resident exposed for 30 years to the low levels of PCE (from the June 2011 sampling event) at the Residence is 5×10^{-6} . This represents a level of risk that is within USEPA's risk range for Superfund sites. The estimated total risk, including exposure to other constituents in the Residence originating from background sources is 5×10^{-5} , primarily due to 1,2-dichloroethane, chloroform, and naphthalene. As noted above, estimated cancer risks for PCE are the same for this sampling event (June 2011) and the combined data results (5×10^{-6}). This is also true for the overall risk calculations; the second sampling round risks and combined risks are equal to 5×10^{-5} and 3×10^{-5} , respectively.

The low concentrations of PCE detected in the basement of the Residence are consistent with those typically measured in residences, as reported by USEPA and MADEP. Measured PCE concentrations from June 2011 are slightly above the MADEP TV of $1.4 \mu\text{g}/\text{m}^3$, but based on the calculated AF, a background source is likely to be present.

5. Recommendations

The two rounds of sub-slab soil vapor and indoor air data collected in April and June 2011 confirm that risks to on-site residents are within USEPA's risk range for Superfund sites. Estimated risks from exposure to constituents detected in indoor air are due primarily to background sources from products used and stored in the Residence. Estimated risks from exposure to PCE remain at the low end of USEPA's risk range and are thought to be influenced by a background source. Based on these findings, no further action is recommended to address the vapor intrusion pathway at the Residence.

Data Validation Report

Phoenix Chemistry Services

Aug. 8, 2011

Nadine Weinberg
ARCADIS, U.S., Inc.
482 Congress Street, Suite 501
Portland, ME 04101

Reference #s: 2011-0705-001 & -002, and 2011-0715-001 & -002

Dear Nadine,

Phoenix Chemistry Services has submitted four reports on August 4 - 5, 2011 presenting the results of the data validation of Sample Delivery Group (SD) Nos. L1108879, L1108880, L1108884, and L1108885 from the Indoor Air Quality/Vapor Intrusion (IAQ/VI) assessment work at several residential and/or commercial properties in Woburn, MA. The indoor and outdoor air and sub-slab vapor samples in these SDGs were collected June 16 - 18, 2011. The laboratory analyses were performed by Alpha Analytical Laboratories, Inc. of Mansfield, MA.

The data packages and electronic deliverables were received on July 5 and 15, 2011. Two separate data packages for the canister certifications (SDG Nos. L1108049 and L1108435), and associated files L1108879.pdf, L1108880.pdf, L1108884.pdf, L1108885A.pdf, and L1108885B.pdf were received on June 16, 2011. The validation has been performed by Phoenix Chemistry Services according to the Tier III guidelines as defined by USEPA Region I, as presented in "Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses", December, 1996. The EPA's National Functional Guidelines for Organic Data Review (EPA 540/R-99/008, October, 1999), the IAQ/VI Quality Assurance Project Plan (QAPP), and the Field-Laboratory Coordination Memorandum (Phoenix Chemistry Services, March 25, 2010) were also considered during the evaluation, and professional judgment was applied as necessary and appropriate. Data qualifiers have been applied in the final validation report as necessary and appropriate, in accordance with these guidelines.

The samples in these four data packages were collected as a single sampling round, and utilized shared quality control (QC) samples, including two trip blanks, four outdoor air samples, four field duplicate pairs, and two laboratory replicates. The trip blanks and laboratory replicates were each logged in and reported in at least two data packages to avoid collecting redundant QC samples, as requested by the field engineer. Only one set of results for these QC samples was retained in the project database to avoid duplications; the earliest laboratory identifier was selected to be validated and reported. The laboratory is maintaining the original reporting packages.

A reporting error was noted in the clean canister certification package SDG No. L1108435; an incorrect copy of the initial calibration was included in the raw data section, and the continuing calibration presented incorrect percent difference values, as the compounds were evaluated against the incorrect initial calibration. The laboratory quickly responded to the validator's request for a copy of the missing initial calibration, however, a revision of the data package with the corrected continuing calibration has not yet been received (the validator performed the checks manually after receiving the correct initial calibration). The laboratory should be reminded that this is still outstanding.

Thank you for this opportunity to provide data validation services to ARCADIS. If there are any questions or concerns about the material in this report, please do not hesitate to contact me for help and clarification.

Sincerely,

Deborah H. Gaynor, Ph.D.

(802) 233-2473
Aug. 4, 2011**

EXECUTIVE SUMMARY

Phoenix Chemistry Services (Phoenix) has completed the validation of the Method TO-15 Selected Ion Monitoring (SIM) volatiles in air analysis data prepared by Alpha Analytical Laboratories of Mansfield, MA, for 5 air samples from a residential property in Woburn, MA. The laboratory reported the data under Sample Delivery Group (SDG) No. L1108880, which was submitted as a single data package received by Phoenix on July 4, 2011, and includes the following samples:

Sample ID	Laboratory ID
IA-5O-4-06162011	L1108880-02
IA-5O-5-06162011	L1108880-03
SS-5O-4-06162011	L1108880-04
DUPSS06172011	L1108880-05
SS-5O-5-06162011	L1108880-06

A cross-reference table of sample IDs was provided in the data package. A separate data package, SDG No. L1108049, containing the supporting documentation (clean can certifications) for the preparation and analysis of the sampling canisters, and a file (L1108880.pdf) containing the raw data for the vacuum check upon receipt and the flow controller rate checks, were also submitted on June 16 and July 4, 2011, respectively.

The samples in this data set represent the indoor air and the sub-slab soil vapor samples (matched to the indoor sampling locations) collected from June 16 to 17, 2011 in Woburn, MA inside a residential building; a trip blank and an ambient air sample collected outdoors at this sample location on June 16, 2011 were reported separately (SDG No. L1108879) but will be discussed in this report. All samples were kept in the engineer's custody after sampling until hand-delivered by laboratory courier to the laboratory on June 18, 2011.

Findings of the validation effort resulted in the following qualifications of sample results:

- Results for naphthalene and 1,3-butadiene in all samples were qualified as estimated (J, UJ).
- Positive results greater than the sample-specific (adjusted) quantitation limit but less than the action limit (at twice the detected concentration) for methylene chloride in samples in the outdoor air sample submitted separately in SDG No. L1108879, and for toluene in samples SS-5O-4-06172011, DUPSS06172011, and SS-5O-5-06172011 were qualified as less than the reported value (U).
- The laboratory appropriately applied "J" qualifiers to the CLP-like sample Form 1s when the concentration of an analyte was less than the sample-specific QL for the analytes naphthalene, 1,2-dibromoethane, and bromodichloromethane in the TO-15 SIM analysis. The validator did not remove these qualifiers; however, no results below the QL were detected for any samples in this sample set.

The Overall Evaluation of Data (Section XVI) summarizes the validation results. The validation findings and conclusions for each analytical parameter are detailed in the remaining sections of this report.

Phoenix Chemistry Services
Aug. 4, 2011

SDG No. L1108880

Documentation problems observed in the data package are described in Section XVII.

This validation report shall be considered part of the data package for all future distributions of TO - 15 SIM (volatiles in air) analysis data for SDG No. L1108880.

INTRODUCTION

Analyses of selected volatiles in air samples were performed according to Method TO-15, as modified for Selected Ion Monitoring (SIM) in the laboratory standard operating procedure (SOP) No. A-001, and in accordance with requirements in the Quality Assurance Project Plan (QAPP) for Indoor Air Quality and Vapor Intrusion Assessment, Rev. 2, March, 2010. The target compound list was limited to the compounds listed in Form K of the QAPP, and reporting limits are as specified there.

Tentative identification of non-target analyte peaks (i.e., tentatively identified compounds, or TICs) was not requested for these analyses.

Phoenix's validation was performed in conformance with Tier III guidelines as defined by USEPA Region I. Data qualifiers are applied as necessary and appropriate. To the extent possible, the data were evaluated in accordance with the "Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses", December, 1996. EPA's National Functional Guidelines for Organic Data Review (EPA 540/R-94/012, 2/94) and the QAPP were also considered during the evaluation, and professional judgment was applied as necessary and appropriate.

The data validation process evaluates data on a technical basis for chemical analyses conducted under the USEPA Contract Laboratory Program (CLP) or other well-defined methods. Contract compliance is evaluated only in specific situations. Issues pertaining to contractual compliance are noted where applicable. It is assumed that the data package is presented in accordance with the CLP requirements. It is also assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate and sufficient quality review prior to submission for validation.

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used by the laboratory to denote specific information regarding the analytical results. During the validation process, laboratory data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data validator. Raw data is examined in detail to check calculations, compound identification, and/or transcription errors. Validated results are either qualified or unqualified; if results are unqualified, this means that the reported values may be used without reservation. Final validated results are annotated with the following codes, as defined in the EPA Region I Functional Guidelines:

- U - The analyte was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit. The sample quantitation limit accounts for sample specific dilution factors and percent solids corrections or sample sizes that deviate from those required by the method.
- J - The associated numerical value is an estimated quantity.
- UJ - The analyte was analyzed for, but was not detected. The sample quantitation limit is an estimated quantity.
- R - The data are unusable (analyte may or may not be present). Resampling and reanalysis is necessary for verification. The R replaces the numerical value or sample quantitation limit.

In some instances (e.g., a dilution) a result may be indicated as “rejected” to avoid confusion when a more quantitatively accurate result is available.

EB, TB, BB - An analyte that was identified in an aqueous equipment (field) blank, trip blank, or bottle blank that was used to assess field contamination associated with soil/sediment samples. These qualifiers are to be applied to soil/sediment sample results only.

These codes are assigned during the validation process and are based on the data review of the results. They are recorded in the “Validator_Qualifier” column, and are also found with the validated laboratory-applied qualifiers in the “Qualifier” column in the electronic spreadsheet contained in Attachment A.

All data users should note two facts. First, **the "R" qualifier means that the laboratory-reported value is completely unusable.** The analysis is invalid due to significant quality control problems, and provides no information as to whether the compound is present or not. Rejected values should not appear on data tables because they have no useful purpose under any circumstances. Second, **no analyte concentration is guaranteed to be accurate even if all associated quality control is acceptable.** While strict quality control conformance provides well-defined confidence in the reported results, any analytical result will always contain some error.

The user is also cautioned that the validation effort is based on the materials provided by the laboratory. Software manipulation, resulting in misleading raw data printouts, cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

Detailed Findings of Measurement Error Associated with the Analytical Analysis

I. Sample Integrity

The indoor air samples for volatiles analysis were collected over a 24-hour period from June 16 to 17, 2011, and the matching sub-slab (soil vapor) samples were collected at mid-day on June 17, 2011 for a 30-minute period. The property is located in Woburn, MA. All analyses were performed within eleven (11) days after sample collection, which is within the 30 day holding time defined in Method TO-15.

The canisters were delivered by laboratory courier to the field sampler's possession and after sampling the canisters were hand-delivered by laboratory courier to the laboratory three days after collection ended; the canisters were kept in the field engineer's office during the intervening days. A separate data package, SDG No. L1108049, was also submitted (on June 16, 2011), containing the supporting documentation (clean can certification) for the preparation and pre-sampling cleanliness check analysis of the canisters; the raw data for the vacuum and flow controller checks, as documented in the file L1108880.pdf was submitted on June 16, 2011.

The Chain of Custody (COC) and the Canister and Flow Controller Information records show that the sample canisters were collected and transported according to method specifications.

All canisters submitted to the field for use met all applicable method requirements. Based on acceptable sampling equipment conditions at receipt, sample integrity was deemed acceptable for all samples.

Field log books containing records of height of canister intake, barometric pressure, and ambient temperature at sampling locations were not submitted for review as part of this validation effort.

II. GC/MS Instrument Performance Check (Tuning)

The samples for volatiles in air analyses from SDG No. L1108880 were analyzed on a single GC/MS system identified as instrument Airlab7. The tuning of this instrument was demonstrated with analysis of 4-bromofluorobenzene (BFB); tunes were analyzed for each 24-hour period during which the samples or associated standards were analyzed. Both BFB tunes were correctly calculated, within acceptance limits, and are reported accurately on the Form 5 summaries in the data package.

III. Initial Calibration (IC)

One IC (6/25/11) was performed on instrument Airlab7 in support of the TO-15 SIM sample analyses. The IC was performed at ten concentration levels (0.02, 0.04, 0.1, 0.2, 0.5, 1.0, 2.5, 5.0, 10, and 50 part per billion by volume [ppbv]), except that the 0.02 ppbv standard was not used for calibration of naphthalene. It was noted that a standard at 20 ppbv was also analyzed and included in the data package, but was not used in the instrument calibration. Documentation of all individual IC standards was present in the data package and relative response factor (RRF) as well as percent relative standard deviation (%RSD) values were correctly calculated and accurately reported on the Form 6 summary.

Manual integrations for some target analytes, internal standards, or surrogate standards were performed in some standards and samples in this data set. The before and after ion chromatograms, the reason for the manual integration, and the analyst's initials and date were printed for each manual integration.

All average RRF values were above the 0.05 minimum criterion, and all %RSDs were below the maximum limit (30%) specified by Region I, with the exception that naphthalene exhibited a 37.3 %RSD.

An Independent Calibration Verification (ICV) sample analysis at 20 ppbv was analyzed on 6/27/11. All spiked analytes were recovered within 70 – 130 % recovery of expected values in the ICV analysis, with the exception of 1,3-butadiene, which was recovered at -41.7 % recovery.

Since the reporting limit for naphthalene is set above the lowest standard used in the calibration, no actions are necessary on the basis of the modification of the initial calibration range for this compound. On the basis of the unacceptably high %RSD value in the associated IC, results for naphthalene in all samples were qualified as estimated (J, UJ). On the basis of the unacceptably low recovery in the associated ICV analysis, results for 1,3-butadiene in all samples were qualified as estimated (UJ).

IV. Continuing Calibration (CC)

One continuing calibration (CC) standard was reported in support of the TO-15 SIM sample analyses reported in this data package; this analysis is also reported as the ICV and as the laboratory control sample analysis for this analytical window. Since this is an independent standard, this is acceptable, although redundant. Sample results were properly reported using the average RRF of the calibration curve for quantitation. Documentation of the standard analysis was present, and RRF as well as percent difference (%D) values were reported on the Form 7 summary within the data package. All RRF values were above the 0.05 minimum criterion, and all %D values were below the maximum limit (25%) specified by Region 1, with the exception of 1,3-butadiene, which exhibited a -41.7 %D.

It should be noted that a positive % D value (the CC response factor is less than the IC response factor) will result in a low bias for positive detects, and a negative % D will result in a high bias for positive detects.

Since results for 1,3-butadiene in all samples were previously qualified for this analysis on the basis of ICV criteria, no further qualifications were applied.

V. Blanks

Results for one air-matrix laboratory method blank (MB) were reported in association with the TO-15 SIM sample analyses. No target compounds were found in the MB.

One trip blank (TB) identified as TB06172011, which was used as a field blank, was reported in a separate data package (SDG No. L1108879). No target compounds were found in the TB, with the exceptions of methylene chloride (9.20 ppbv), and toluene (0.094 ppbv), which are both above their respective quantitation limits (0.50 and 0.050 ppbv).

Neither a trip blank nor a field blank is required for Method TO-15.

On the basis of field contamination and professional judgment, positive results greater than the sample-specific (adjusted) quantitation limit but less than the action limit (at twice the detected concentration) for methylene chloride in the outdoor air sample submitted separately in SDG No. L1108879, and for toluene in samples SS-50-4-06172011, DUPSS06172011, and SS-50-5-06172011 were qualified as less than the reported value (U).

VI. Surrogate Compounds

No surrogate compounds are used in these methods.

VII. Internal Standards (IS)

All IS areas and retention times (RT) were within the established QC limits for all reported sample analyses in this data package.

VIII. Laboratory Duplicates

A matrix spike/matrix spike duplicate (MS/MSD) analysis is not used in this method. A laboratory duplicate analysis of a field sample (matrix duplicate) analysis is also not required but was performed per laboratory protocols. A laboratory duplicate was selected from the samples collected during the same sampling set on June 16-17, 2011, and reported in SDG No. L1108879. Relative percent difference (RPD) values were reported on a Form 3 summary within that data package.

Precision in the laboratory duplicate analyses (6.8 – 11.5 %RPD) was acceptable (less than 30 % RPD, for all analytes greater than five times the reporting limit) on the basis of professional judgment.

IX. Field Duplicates

One field duplicate pair was reported in this sample set. Sample DUPSS06162011 was identified as the field duplicate of sample SS-50-4-06162011.

Relative percent difference (RPD) values for compounds detected at greater than five times the quantitation limit in at least one member of a field duplicate pair must be less than 25 %RPD as per the QAPP. Precision in the field duplicate pair for naphthalene, the only detected analyte meeting threshold criteria, was acceptable (2.9 %RPD).

X. Sensitivity Check

An MDL study for the TO-15 SIM method was analyzed by the laboratory on May 7, 2009, and the most recent verification study was performed between February 3 and 4, 2010. All target analytes in the

statistical study had calculated MDLs below the method quantitation limits (QLs), and demonstrated acceptable ratios (at least 3:1) of the QL to the MDL. The QLs are also supported by the low concentration standard (at 0.020 ppbv) in the initial calibration.

Project objectives required a low reporting limit (RL) for naphthalene, and in order to achieve project objectives for detection limits, the analytes 1,2-dibromoethane (EDB), bromodichloromethane, and naphthalene were evaluated by the laboratory down to one-half the RL; concentrations between one-half the RL and the RL were reported with a "J" qualifier to indicate that this was an estimated concentration on the Form 1 summaries; results below the QL were only detected for naphthalene in this sample set.

On the basis of acceptable sensitivity and accuracy, as demonstrated by the MDL study and supported by the initial calibration, all results for the TO-15 SIM method (detects and non-detects) not qualified for other reasons are deemed acceptable as reported.

XI. Performance Evaluation Samples (PES)/Accuracy Check

One zero blind PE samples (commonly known as a laboratory control sample, LCS) was prepared and analyzed by the laboratory in support of the TO-15 SIM sample analyses; this analysis was also reported as the ICV and as the CC standard analysis for this data set. All target analytes were spiked into the QC samples at 20 ppbv. Percent recoveries (%R) were correctly calculated for the spiked compounds, accurately reported on the Form 3 summary in the data package, and were within the laboratory established QC limits (70 - 130 %R) for all target analytes, with the exception (previously noted) of 1,3-butadiene, which was recovered at -41.7 %. No spiked duplicate analyses were performed for either method, so laboratory precision was not evaluated using spiked analyses.

No external single-blind PES sample for either method was required or submitted with the samples in this data set.

Since all samples in this data set were previously qualified for the unacceptably low recovery of 1,3-butadiene in this analysis (as an ICV), no further qualifications were applied.

XII. Target Compound Identification

Reported target compounds were correctly identified for all samples in this data set.

XIII. Compound Quantitation and Reported Quantitation Limits

Target compound quantitation and practical quantitation limits (PQLs) were accurately reported on the Form 1 summaries. Results below the RL are not reported by the laboratory for this method. However, at the client's request, positive results for naphthalene, bromodichloromethane, and 1,2-dibromoethane (EDB) were evaluated down to one-half the RL, and reported with a "J" qualifier by the laboratory on the Form 1s.

One compound was reported with reporting limits slightly higher than specified in the QAPP. Total xylenes were reported with a quantitation limit of 0.261 ug/m³. No qualifications were deemed necessary on

the basis of the RL slightly above that specified in the QAPP for total xylenes, since this concentration is still well below the risk screening level.

The laboratory appropriately applied “J” qualifiers to the CLP-like sample Form 1s when the concentration of an analyte was less than the sample-specific QL for the analytes naphthalene, 1,2-dibromoethane, and bromodichloromethane in the TO-15 SIM analysis. The validator did not remove these qualifiers (no results below the QL were detected for any samples in this sample set).

The values that the validator has judged to be acceptable are presented on the electronic deliverable generated from the project database (Attachment A). Qualifiers applied by the validator during the validation effort have been listed on the electronic spreadsheet in an additional column labeled “Validator_Qualifier”. The column labeled “Qualifier” contains both qualifiers applied by the laboratory and those applied by the validator; all qualifiers in this column have been accepted or changed during the validation effort. The column labeled “PreValidationFlag”, which is generated by the database utility, also indicates which qualifiers were changed by the validator. Sample-specific quantitation limits may be found on the Form 1 for each sample or in the electronic deliverable (Attachment A, column “ReportingLimit”).

The Form 1s submitted in the data package present results in units of $\mu\text{g}/\text{m}^3$ as well as in ppbv. Results are also presented almost entirely in units of $\mu\text{g}/\text{m}^3$ in the electronic data deliverable (EDD). Both the forms and the EDD were examined during the data validation process.

All positive results are listed on the electronic data deliverable, whether or not the value or qualifier was changed as a result of the validation. All non-detected results are listed on the electronic data deliverable with a Qualifier of “U” or “UJ”; these are also found as less-than ($<$) values in the “TextResult” column. If the reported result value was changed during the validation effort from a positive result to a value representing a concentration not detected at or below, the value representing the new reporting limit is reported as the Result with a Validator Qualifier of “U” or “UJ” and a “ $<$ ” sign in the “TextResult” column.

XIV. Tentatively Identified Compounds (TICs)

Evaluation of unidentified, non-target analyte peaks was not requested or performed for these samples.

XV. System Performance

The analytical system appears to have been working acceptably, based on instrument printouts and spectral quality.

XVI. Overall Evaluation of Data

Findings of the validation effort resulted in the following qualifications:

- On the basis of the unacceptably high %RSD value in the associated IC, results for naphthalene in all samples were qualified as estimated (J, UJ).

- On the basis of the unacceptably low recovery in the associated ICV analysis, results for 1,3-butadiene in all samples were qualified as estimated (UJ).
- On the basis of field contamination and professional judgment, positive results greater than the sample-specific (adjusted) quantitation limit but less than the action limit (at twice the detected concentration) for methylene chloride in the outdoor air sample submitted separately in SDG No. L1108879, and for toluene in samples SS-50-4-06172011, DUPSS06172011, and SS-50-5-06172011 were qualified as less than the reported value (U).
- The laboratory appropriately applied “J” qualifiers to the CLP-like sample Form 1s when the concentration of an analyte was less than the sample-specific QL for the analytes naphthalene, 1,2-dibromoethane, and bromodichloromethane in the TO-15 SIM analysis. The validator did not remove these qualifiers; however, no results below the QL were detected for any samples in this sample set.

XVII. Documentation

The required records for canister cleanliness were submitted as a separate data package, SDG No. L1108049, and all required records were properly included with this data package. Canister cleanliness and auxiliary equipment status was acceptable upon release from the laboratory, and appropriate checks and actions were performed as required upon sample and equipment receipt.

The chain of custody (COC) records were present and accurately completed for all reported samples.

Data presentation was acceptable, with the following observation:

- One compound was reported with reporting limits slightly higher than specified in the QAPP. Total xylenes were reported with a quantitation limit of 0.261 ug/m³.

This validation report should be considered part of the data package for all future distributions of the TO-15 SIM (volatiles in air) analysis data for SDG No. L1108880.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

Report Submission

This report replaces the report issued on July 1, 2011. The client sample identifications for L1108880-01 through L1108880-04 and L1108880-06 have been amended.

The canister certification results are provided as an addendum.

L1108880-03 The RPD of the pre- and post-flow controller calibration check (29% RPD) was outside acceptable limits (< or = 20% RPD).

Volatile Organics in Air (SIM)

1,2-Dibromoethane, Bromodichloromethane and Naphthalene were evaluated to 1/2 the RL and are J qualified if the concentration is below the quantitation limit (RDL), but greater than or equal to 1/2 the RDL. Values are

GLOSSARY

Acronyms

EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

- | | |
|----------|--|
| A | - Spectra identified as "Aldol Condensation Product". |
| B | - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. |
| C | - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses. |
| D | - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte. |
| E | - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument. |
| G | - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated. |
| H | - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection. |
| I | - The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference. |
| M | - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte. |
| P | - The RPD between the results for the two columns exceeds the method-specified criteria. |
| Q | - The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less |

Report Format: DU Report with "J" Qualifiers

Project Name: UNIFIRST WELLS G&H
Project Number: MA000989.0002.00003

Lab Number: L1108880
Report Date: 08/05/11

Data Qualifiers

than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

J - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL). This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the method detection limit (MDL) for the sample.

Report Format: DU Report with "J" Qualifiers

Project Name: UNIFIRST WELLS G&H
Project Number: MA000989.0002.00003

Lab Number: L1108880

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certificate/Approval Program Summary

Last revised August 4, 2011 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held. For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

Connecticut Department of Public Health Certificate/Lab ID: PH-0141.

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

Florida Department of Health Certificate/Lab ID: E87814. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C, 8270D.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C, 8270D.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C, 8270D.)

Air & Emissions (EPA TO-15.)

New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: EPA, 245.1, 245.7, 1631E, 180.1, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081, 8082, 8260B, 8270C.)

Solid & Chemical Materials (Inorganic Parameters: SW-846 1311, 1312, 3050B, 3051A, 3060A, 6020A, 7470A, 7471A, 9040B, 9045C, 7196A. Organic Parameters: SW-846 3540C, 3580, 3630C, 3640A, 3660B, 3665A, 5035, 8260B, 8270C, 8015D, 8082, 8081A.)

New Jersey Department of Environmental Protection Certificate/Lab ID: MA015. *NELAP Accredited.*

Non-Potable Water (Inorganic Parameters: SW-846 1312, 3010, 3020A, 3015, SM2320B, SM2540D, 2540G, , EPA 180.1, 1631E, SW-846 7470A, 9040B, 6020. Organic Parameters: SW-846 3510C, 3580A, 5030B, 5035L, 5035H, 3630C, 3640C, 3660B, 3665A, 8015B 8081A, 8082, 8260B, 8270C)

Solid & Chemical Materials (Inorganic Parameters: SW-846 6020, 1311, 1312, 3050B, 3051, 3060A, 7196A, 7470A, 7471A, 9040B, 9045C, 9050A, 9060. Organic Parameters: SW-846 3540C, 3570, 3580A, 5030B, 5035L, 5035H, 3630C, 3640A, 3660B, 3665A, 8081A, 8082, 8260B, 8270C, 8015B.)

Atmospheric Organic Parameters (EPA TO-15)

Biological Tissue (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3610C, 3630C, 3640A)

New York Department of Health Certificate/Lab ID: 11627. **NELAP Accredited.**

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 245.7, 7470A, 9014, 9040B, 9050, 120.1, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 3020A. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

Air & Emissions (EPA TO-15.)

Rhode Island Department of Health Certificate/Lab ID: LAO00299. **NELAP Accredited via LA-DEQ.**

Refer to LA-DEQ Certificate for Non-Potable Water.

Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. **NELAP Accredited.**

Solid & Chemical Materials (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

Air (Organic Parameters: EPA TO-15)

Washington State Department of Ecology Certificate/Lab ID: C954. *Non-Potable Water* (Inorganic Parameters: SM2540D, 2510B, EPA 120.1, 180.1, 1631E, 245.7.)

Solid & Chemical Materials (Inorganic Parameters: EPA 9040, 9060, 6020, 7470, 7471, 7474. Organic Parameters: EPA 8081, 8082, 8015 Mod, 8270, 8260.)

U.S. Army Corps of Engineers

Department of Defense Certificate/Lab ID: L2217.01.

Non-Potable Water (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 5030B, 8260B, 8270C, 8270C-ALK-PAH, 8082, 8081A, 8015D-SHC.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 1311, 1312, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 5035A, 8260B, 8270C, 8270-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015-DRO.

Air & Emissions (EPA TO-15.)

Analytes Not Accredited by NELAP

Certification is not available by NELAP for the following analytes: **8270C**: Biphenyl. **TO-15**: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.

---	-------------

1. Introduction

ARCADIS has prepared a preliminary human health risk assessment based upon validated indoor air data presented in Table 1 of the Indoor Air Quality and Vapor Intrusion Assessment: Report of Second Sampling Round Results, Residence, Parcel 26/ 05/ 05 – South, Wells from samples collected on June 16-17, 2011 at the southern half of the residential duplex at Woburn Parcel Number 26/ 05/ 05 (the Residence). The list of compounds of potential concern (COPCs) is in accordance with Table 1 of the *Indoor Air Quality and Vapor Intrusion Assessment Scope of Work (SOW)* (The Johnson Company [JCO] 2010a) submitted to the United States Environmental Protection Agency (USEPA) by JCO on behalf of the UniFirst Corporation in March 2010 and Table 2 of *Indoor Air Quality and Vapor Intrusion Assessment: Report of Results (IAQA/VI)* (JCO 2010b). COPCs that were detected in any indoor air sample were considered in the risk assessment.

2. Comparison to Acute Exposure Criteria

In order to screen for potential near-term human health hazards, indoor air data from June 2011 were compared to two sets of acute exposure criteria, including Acute Minimal Risk Levels (MRLs) and Acute Exposure Guideline Levels (AEGLs). In addition, indoor air data were compared to occupational criteria, including Permissible Exposure Limits (PELs) and Threshold Limit Values (TLVs®) (Table 1). Acute inhalation MRLs are derived by the Agency for Toxic Substances and Disease Registry (ATSDR) for noncarcinogenic effects from exposures lasting 14 days or less. AEGLs are set by USEPA for infrequent or one-time exposures to airborne compounds. An eight-hour AEGL-1 represents a level above which it is expected that the general population could experience significant but reversible irritation or discomfort. PELs are federal standards enforceable by the Occupational Safety and Health Administration (OSHA) for an eight-hour time-weighted average occupational exposure. TLVs® are eight-hour time-weighted averages proposed by the American Conference of Governmental Industrial Hygienists (ACGIH) for occupational hazard assessment. If no acute exposure criteria or occupational criteria were available for a given compound, surrogate values were used where appropriate (Table 1). Comparisons were based on individual samples (i.e., assuming that an individual person would consistently remain at the sample location throughout the relevant exposure period).

No June 2011 result exceeded acute exposure criteria. Thus, acute indoor air exposures to the COPCs would not pose significant risks of harm to human health.

3. Risk Evaluation

Indoor air and outdoor air samples were collected at the Residence on June 16 and 17, 2011. Subslab soil vapor samples were collected on June 17, 2011. The indoor air samples were collected at two locations in the basement of the Residence. Analytical results indicate that 13 constituents were detected in indoor air (Table 2). Of these 13 constituents, 1,2-dichloroethane, 1,2-dichloropropane, 1,3-butadiene, benzene, bromodichloromethane, ethylbenzene, toluene, and xylenes were detected only in indoor air and not in sub-slab soil vapor, indicating that concentrations detected were associated with background sources. Five of the 13 constituents detected in indoor air were detected in sub-slab soil vapor, including 1,2,4-trimethylbenzene, carbon tetrachloride, chloroform, naphthalene, and tetrachloroethene (Table 2). Carbon tetrachloride and naphthalene were detected at nearly equivalent concentrations in both indoor and outdoor air, indicating that the indoor detected concentrations may be associated with background sources. Calculated attenuation factors (AF) were close to or greater than 1.0 for 1,2,4-trimethylbenzene, carbon tetrachloride, chloroform, and naphthalene, indicating these compounds were detected at greater concentrations in indoor air than sub-slab soil vapor and are therefore primarily associated with background sources. The calculated AF for tetrachloroethene (PCE) was 0.27, also indicating potential contributions from a background source.

During pre-sampling activities, ARCADIS staff conducted a building survey to document building conditions and products that were found in the basement of the Residence. The first and second floors of the Residence were included in a limited building survey and the tenants of the Residence were not available at the time of sampling to be interviewed. Additional background sources therefore may have been present. The following potential background sources were identified during the survey:

- Cleaning products containing bleach were noted in the home during the site visit, which may be a source of chloroform via reactions with other cleaning products (Odabasi 2008).
- Various other cleaning products and aerosols were also noted.

Risks from inhalation of volatile organic compounds in indoor air were estimated for a current resident for both long- and short-term exposures. Exposure assumptions were based on current USEPA guidance (USEPA 2009) (Table 3).

In accordance with USEPA guidance, long-term exposure was defined as 30 years for a current resident. The short-term exposure was performed for a five-year exposure in accordance with Massachusetts Department of Environmental Protection (MADEP) guidance for Imminent Hazard (IH) evaluations to determine if an IH condition existed as defined in the Massachusetts Contingency Plan (MCP) (MADEP 2008a). As specified in the MCP, the IH evaluation was performed for current use receptors: current residents.

For each constituent, the exposure point concentration in indoor air is equal to the average concentration of the indoor air results. Residents were assumed to be present 24 hours per day in the building. Exposure parameters for each scenario are presented in Table 3.

Risks were estimated according to USEPA (2009) guidance and the MCP (MADEP 2008a). Volatile organic compounds in indoor air were not considered to pose significant cumulative risk to human health within or below the USEPA Superfund target excess lifetime cancer risk range of 1×10^{-6} to 1×10^{-4} for potential carcinogenic effects and a target Hazard Index (HI) of 1 for potential noncarcinogenic effects. The criteria applicable to the MADEP IH evaluation are a target excess lifetime cancer risk of 1×10^{-5} for potential carcinogenic effects and a target HI of 1 for potential noncarcinogenic effects.

The risk assessment was executed on all constituents that were detected in at least one indoor air sample, including several constituents that have been demonstrated *not* to be site-related. Carbon tetrachloride and naphthalene were detected at similar concentrations in outdoor air compared to indoor air. 1,2-Dichloroethane, 1,2-dichloropropane, 1,3-butadiene, benzene, bromodichloromethane, ethylbenzene, toluene, and xylenes were not detected in any sub-slab soil vapor sample. 1,2,4-Trimethylbenzene, carbon tetrachloride, chloroform, and naphthalene were detected at similar or higher concentrations in indoor air compared to sub-slab soil gas. 1,2,4-Trimethylbenzene, benzene, chloroform, ethylbenzene, toluene, and xylenes were also detected in outdoor air, so ambient air may have contributed to background concentrations. These constituents are present as a result of sources within the building and are not within the scope of a release to the environment addressed under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA).

Risks from an initial sampling event at this property (April 21-22, 2011) were presented in Appendix E of the Indoor Air Quality and Vapor Intrusion Assessment: Report of

Results submitted to USEPA on May 23, 2011. To evaluate potential risks over both the initial and current sampling event, risks were calculated considering chemicals detected in indoor air from both the initial sampling event (April 2011) and the second round of sampling (June 16 and 17, 2011). Any constituent that was detected in either the April or June indoor air sampling was included in the combined risk calculation. Risks were estimated using the average concentration from both sampling rounds. Risks associated with both data sets are referred to as “Combined Results” below.

4. Current Results

No indoor air sample exceeded acute exposure criteria or occupational criteria, and acute indoor air exposures to the COPCs are not estimated to pose significant risks to human health.

4.1 Current Resident (Short-Term)

As presented in Table 4, the cumulative estimated lifetime cancer risks for a short-term (five-year) exposure period to a current resident exposed to the average concentrations of COPCs detected in indoor air in the Residence did not exceed the MADEP IH target risk level of 1×10^{-5} (Table 4). Cumulative non-cancer hazards are equal to 0.4 for this exposure scenario. No IH condition as defined by the MCP was found to exist at the Residence for the short-term resident exposure scenario.

All risks for exposure to COPCs in indoor air were within the Superfund target excess lifetime cancer risk range of 1×10^{-6} to 1×10^{-4} and no individual chemical risk exceeded 3×10^{-6} (Table 4). It should be noted that 34% of the risk was due to exposure to constituents that were not detected in any sub-slab soil vapor sample – 1,2-dichloroethane, 1,2-dichloropropane, 1,3-butadiene, benzene, bromodichloromethane, and ethylbenzene. Additionally, 41% of risk was due to chloroform, which was detected at higher concentrations in indoor air than sub-slab soil vapor. Risks associated with PCE only account for 11% of the total risk, or an estimated risk level of 8×10^{-7} . Based on a comparison of concentrations for both the north and south sides of the duplex, background sources of PCE (dry-cleaned clothes) are likely contributing to this risk level (Magee et al. 2008).

4.2 Current Resident (Long-Term)

Cumulative estimated cancer risks for a long-term (30-year) exposure period to a current resident exposed to the average concentrations of COPCs detected in indoor

air were within the Superfund target excess lifetime cancer risk range of 1×10^{-6} to 1×10^{-4} (Table 5). Cumulative non-cancer hazards are equal to 0.4 for this exposure scenario. Constituents not detected in sub-slab soil vapor (1,2-dichloroethane, 1,2-dichloropropane, 1,3-butadiene, benzene, bromodichloromethane, and ethylbenzene) make up 34% of the total risk, and chloroform accounts for 41% of total risk. The risk associated with exposure to PCE in indoor air is 5×10^{-6} for the long term current resident. This constitutes 11% of the total risk for the long term resident. Background sources of PCE are likely contributing to this risk level.

5. Combined Results

The results from the April 2011 and June 2011 data were combined to determine the potential overall risk from exposure to constituents detected in indoor air.

5.1 Current Resident (Short-Term)

Table 6 presents the results of the combined indoor air data evaluation. The cumulative estimated lifetime cancer risks for current resident exposed to the COPCs for short-term (5-year) exposure period did not exceed the MADEP IH target risk level of 1×10^{-5} (Table 6). Non-cancer hazards for the combined results are equal to 0.3 for this exposure scenario. No IH condition as defined by the MCP was found to exist at the Residence for the short-term resident exposure scenario.

All risks to COPCs in indoor air from the combined results were within the Superfund target excess lifetime cancer risk range of 1×10^{-6} to 1×10^{-4} and no individual chemical risks exceeded 2×10^{-6} (Table 6). It should be noted that the majority of risk (64%) from the combined results was due to exposure to 1,2-dichloroethane, chloroform, and naphthalene which are likely to be present in indoor air from background sources. Risks associated with PCE only account for 15% of the total risk, or an estimated risk level of 8×10^{-7} over both events.

5.2 Current Resident (Long-Term)

Cumulative estimated cancer risks for a long-term (30-year) exposure period to a current resident exposed to combined results in indoor air were within the Superfund target excess lifetime cancer risk range of 1×10^{-6} to 1×10^{-4} (Table 7). All non-cancer hazards are equal to 0.3 for this exposure scenario (Table 7). 1,2-Dichloroethane, chloroform, and naphthalene continue to drive the estimated risk level, making up 64%

of risk. The risk associated with exposure to PCE in indoor air from the combined results is 5×10^{-6} for the long term current resident.

6. Conclusions and Recommendations

In the June 2011 sampling round, no indoor air sample exceeded acute exposure criteria or occupational criteria, and acute indoor air exposures to the COPCs are not estimated to pose significant risks to human health. Cumulative estimated carcinogenic and noncarcinogenic risks for current residents did not exceed target risk levels for a short-term (five-year) exposure period. No IH condition as defined by the MCP was found to exist at the Residence.

Long term estimated excess lifetime carcinogenic risks for current residents (30 years) are all within the Superfund target excess lifetime cancer risk range of 1×10^{-6} to 1×10^{-4} considering average indoor air concentrations and do not exceed 5×10^{-5} under any exposure scenario. All non-cancer HIs are below 1. All supporting risk assessment tables are provided in Attachment A.

PCE was detected in the June 2011 sampling round at low levels (1.82 to $2.34 \mu\text{g}/\text{m}^3$) that are consistent with background sources in residences throughout the United States. USEPA's indoor air background database reported a 50th percentile value of $0.7 \mu\text{g}/\text{m}^3$, a 75th percentile value of $1.4 \mu\text{g}/\text{m}^3$ and a 90th percentile value of $3.8 \mu\text{g}/\text{m}^3$ for PCE (Dawson 2008). The potential carcinogenic risk level estimated for the low levels of PCE detected in the Residence is 5×10^{-6} for long-term exposure, a level of risk within USEPA's risk range for Superfund sites. The estimated total long-term risk, including exposure to other compounds in the Residence originating from background sources (i.e., *not* site related), is 5×10^{-5} . The PCE concentrations measured in the Residence are above the MADEP (2008b) Threshold Value (TV) for PCE ($1.4 \mu\text{g}/\text{m}^3$), but based on the calculated AF a background source is likely present (Magee et al. 2008).

The risk evaluation of the combined data confirms the results reported above and in the previous (May 23, 2011) human health risk assessment. Using all the data, the overall risk level was similar to the current data set. In all cases, background constituents are the primary risk driver in indoor air (see Section 3.3 of the Indoor Air and Vapor Intrusion Assessment). In contrast, PCE only accounts for a small percentage (11-15%) of the overall risk level. Concentrations of background constituents detected in indoor air were slightly higher in the June 2011 samples than in the April 2011 samples. PCE concentrations in indoor air and sub-slab soil vapor

were similar in both events. The average indoor air PCE concentration was $1.96 \mu\text{g}/\text{m}^3$ for the April 2011 sampling event and $2.08 \mu\text{g}/\text{m}^3$ for the June 2011 sampling event.

Notes:

(a) Attenuation Factor calculated as the ratio of the average detected indoor air to average detected sub-slab soil vapor concentration

U - Constituent not detected

µg/m³ - Micrograms per cubic meter

IA - Indoor air sample

OA - Ambient air sample

SS - Sub-slab soil vapor sample

NA - Not applicable

ND - Not detected

Table 3. Exposure Assumptions for the Estimation of Risks from Inhalation of Volatile Constituents in Indoor Air for a Resident

Parameter	Units	Resident – Short Term			Resident – Long Term		
		Value	Source	Comment	Value	Source	Comment
Exposure Time	hours/day	24	(a)		24	(a)

$$ADE = \frac{EPC_{air} \times ET \times EF \times ED}{AT}$$

$$HI_{inh} = \frac{ADE}{RfC}$$

$$Risk = ADE \times URF \times CF$$

Notes:

(a) EPC calculated as average of detected concentrations and one-half indoor air detection limit for non-detects.

EC = exposure concentration

EPC - exposure point concentration

RfC - reference concentration

URF - unit risk factor

ADE-c - average daily exposure (cancer)

ADE-nc - average daily exposure (noncancer)

HI - noncancer hazard index

ug/mg3 - microgram per cubic milligram

NA - Not available

ND - Not detected

mg/m3 - milligram per cubic meter
